Upon Successful Completion of Cohort 3, Cellectar Biosciences Initiates Fourth Cohort of Its Phase I Clinical Trial of CLR 131 in Multiple Myeloma

25mCi/m² Dose Determined to Be Safe and Well-Tolerated

MADISON, Wis., Feb. 22, 2017 (GLOBE NEWSWIRE) -- Cellectar Biosciences, Inc. (Nasdaq:CLRB), an oncology-focused clinical stage biotechnology company, today announces the successful completion of Cohort 3 and initiation of Cohort 4 in the company's Phase I clinical study of CLR 131 in patients with relapsed and refractory multiple myeloma.

The fourth cohort of the Phase 1 study will consist of at least three patients with relapsed or refractory multiple myeloma that have been treated previously with at least one proteasome inhibitor and one immunomodulatory agent. Per protocol, Cohort 4 patients will receive 31.25 mCi/m² of CLR 131 as a single dose infusion, a 25 percent increase in the 25 mCi/m² dose from the third cohort and a 150 percent increase from Cohort 1, all of which were demonstrated to be safe and well tolerated. It is important to note that a key objective of this Phase I clinical trial includes the establishment of the maximum tolerated single dose of CLR 131 as defined by the occurrence of dose limiting toxicities.

Initiation of the fourth cohort occurs well ahead of the company's guidance, which called for initiation to occur at the end of the second quarter of 2017. Further, the company continues to follow all 12 evaluable patients in each of the three previously completed cohorts, which include eight patients from Cohorts 1 and 2 who continue to extend median overall survival. Cellectar expects to provide a detailed data update on these patients by the end of the second quarter of 2017.

"Our enthusiasm for CLR 131's potential in multiple myeloma patients continues to grow given the positive safety, efficacy markers, progression-free survival and median overall survival results that we have observed to date in the Phase I trial, particularly given such a heavily pretreated patient population," said Jim Caruso, president and CEO of Cellectar Biosciences. "We will explore the potential enhanced clinical benefits of a two-dose regimen in our imminent Phase II study, and look forward to updating investors on results of the fourth cohort when available."

The primary study objective of this multi-center, open label Phase I dose escalation study is to characterize the safety and tolerability of CLR 131 administered as a single dose, 30-minute infusion in patients with relapsed or refractory multiple myeloma. Secondary study objectives include establishment of a recommended single dose for Phase II, both with and without dexamethasone, as well as an assessment of therapeutic activity.

In addition, the company recently brought forward guidance for the initiation of its NCI-supported Phase II trial in multiple myeloma and other selected hematologic cancers to the first quarter of 2017. The company expects that all patients will receive a single dose of CLR 131 at 25 mCi/m² infused over approximately 30 minutes, with the option of a second 25 mCi/m² dose 75-180 days later, based upon physician assessment. The Phase II study will be conducted in up to 15 centers across the United States and Cellectar anticipates initial efficacy data as early as the second half of 2017.

About CLR 131

CLR 131 is an investigational compound under development for a range of hematologic malignancies. It is currently being evaluated in a Phase I clinical trial in patients with relapsed or refractory multiple myeloma. The company plans to initiate a Phase II clinical study to assess efficacy in a range of B-cell malignancies in the first quarter of 2017. Based upon pre-clinical and interim Phase I study data, treatment with CLR 131 provides a novel approach to treating hematological diseases and may provide patients with therapeutic benefits, including overall response rate (ORR), an improvement in progression-free survival (PFS) and overall quality of life. CLR 131 utilizes the company's patented PDC tumor targeting delivery platform to deliver a cytotoxic radioisotope, iodine-131 directly to tumor cells. The FDA has granted Cellectar an orphan drug designation for CLR 131 in the treatment of multiple myeloma.

About Phospholipid Drug Conjugates (PDCs)

Cellectar's product candidates are built upon its patented cancer cell-targeting delivery and retention platform of optimized phospholipid ether-drug conjugates (PDCs). The company deliberately designed its phospholipid ether (PLE) carrier platform to be coupled with a variety of payloads to facilitate both therapeutic and diagnostic applications. The basis for selective tumor targeting of our PDC compounds lies in the differences between the plasma membranes of cancer cells compared to those of normal cells. Cancer cell membranes are highly enriched in lipid rafts, which are glycolipoprotein

microdomains of the plasma membrane of cells that contain high concentrations of cholesterol and sphingolipids, and serve to organize cell surface and intracellular signaling molecules. PDCs have been tested in more than 80 different xenograft models of cancer.

About Collectar Biosciences, Inc.

Collectar Biosciences is developing phospholipid drug conjugates (PDCs) designed to provide cancer targeted delivery of diverse oncologic payloads to a broad range of cancers and cancer stem cells. Collectar's PDC platform is based on the company's proprietary phospholipid ether analogs. These novel small-molecules have demonstrated highly selective uptake and retention in a broad range of cancers. Collectar's PDC pipeline includes product candidates for cancer therapy and cancer diagnostic imaging. The company's lead therapeutic PDC, CLR 131, utilizes iodine-131, a cytotoxic radioisotope, as its payload. CLR 131 is currently being evaluated under an orphan drug designated Phase I clinical study in patients with relapsed or refractory multiple myeloma. In addition, the company plans to initiate a Phase II clinical study to assess efficacy in a range of B-cell malignancies in the first quarter of 2017. The company is also developing PDCs for targeted delivery of chemotherapeutics such as paclitaxel (CLR 1603-PTX), a preclinical stage product candidate, and plans to expand its PDC chemotherapeutic pipeline through both in-house and collaborative R&D efforts.
